Interesting facts

Impacts:

Cherry laurel grows rapidly and forms dense thickets, shading out other plants and preventing the regeneration of trees in woodlands. The leaf litter is acidic and makes the soil less suitable for native species.

Habitat:

Found in woodland and scrub, roadside, private and public gardens.

A vigorous large evergreen shrub or small tree often used as hedging or game cover.

Introduced to Britain by 1611 and found in the wild by 1886.

How it spreads:

Spreads by seed that is carried by wind or birds eating the berries and dispersing seed through their poo. Also spreads vegetatively by branches layering on the ground and rooting.

Take action

Help **stop** the **spread!**

Cut back in spring to stop flowers developing.

Deadhead after flowers have faded to prevent berries from developing.

Remove mature plants by digging, taking care to remove the roots.

Remove seedlings by hand-pulling or digging.

It's best not to compost berries or leaves at home, instead use council garden waste facilities.
